Midterm-PartB-Adam-Nelson-Archer

March 12, 2026

1 Midterm Part B :: Image Histograms & ResNet-50 Transfer Learning

COSC 6373 – Adam Nelson-Archer, 2140122

1.1 Prerequisites

- Install packages if needed:
  - `pip install -U tensorflow matplotlib numpy pandas scikit-learn Pillow`
- Dataset: Horses and Camels
  - Expected layout: `data/train/{horse,camel}/` and `data/test/{horse,camel}/`

[1]:
```
from __future__ import annotations

import random
import urllib.request
from pathlib import Path

import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import tensorflow as tf
from PIL import Image
from sklearn.metrics import (
    ConfusionMatrixDisplay,
    accuracy_score,
    confusion_matrix,
)
from tensorflow.keras import layers
from tensorflow.keras.applications import ResNet50
from tensorflow.keras.applications.resnet50 import preprocess_input

SEED = 6373
random.seed(SEED)
np.random.seed(SEED)
tf.random.set_seed(SEED)

print("TensorFlow:", tf.__version__)
```

```
TensorFlow: 2.16.1
```

[2]:
```
gpus = tf.config.list_physical_devices("GPU")
if gpus:
    for gpu in gpus:
        tf.config.experimental.set_memory_growth(gpu, True)
    print("GPU(s) available:", [g.name for g in gpus])
    print("TensorFlow will use GPU for training and inference.")
else:
    print("No GPU found -- TensorFlow will use CPU.")
```

```
No GPU found -- TensorFlow will use CPU.
```

1.2 Q1: Unnormalized RGB Channel Histograms (25 pts)

Download an image from the internet, then calculate and plot the unnormalized (raw pixel-count) histograms for the red, green, and blue channels.

[3]:
```
IMG_URL = (
    "https://upload.wikimedia.org/wikipedia/commons/thumb/"
    "b/b6/Image_created_with_a_mobile_phone.png/"
    "1280px-Image_created_with_a_mobile_phone.png"
)
IMG_PATH = Path("images/q1_image.jpg")
FALLBACK_PATH = Path("images/image.jpg")

IMG_PATH.parent.mkdir(parents=True, exist_ok=True)
if not IMG_PATH.exists():
    try:
        print(f"Downloading image from {IMG_URL} ...")
        urllib.request.urlretrieve(IMG_URL, IMG_PATH)
        print(f"Saved to {IMG_PATH}")
    except Exception as e:
        print(f"Download failed ({e}), using local fallback.")
        IMG_PATH = FALLBACK_PATH
else:
    print(f"Using cached image: {IMG_PATH}")

img_pil = Image.open(IMG_PATH).convert("RGB")
img_arr = np.array(img_pil)
print(f"Image shape: {img_arr.shape}  (H x W x C)")

plt.figure(figsize=(6, 4))
plt.imshow(img_arr)
plt.title("Source Image (from the internet)")
plt.axis("off")
plt.tight_layout()
```

```
plt.show()
```

```
Downloading image from https://upload.wikimedia.org/wikipedia/commons/thumb/b/b6

```

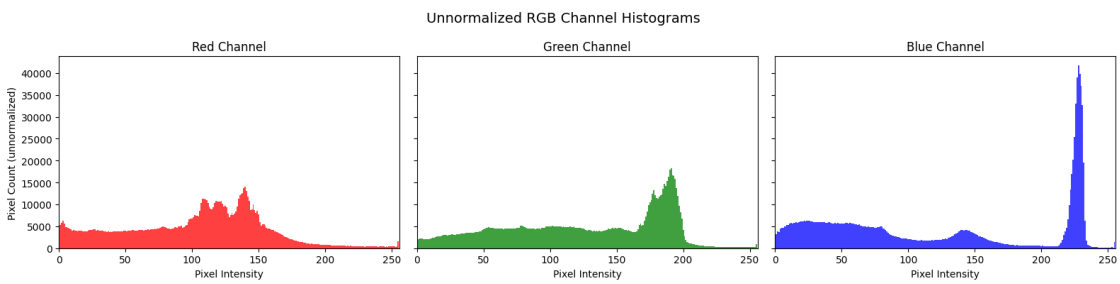
Source Image (from the internet)

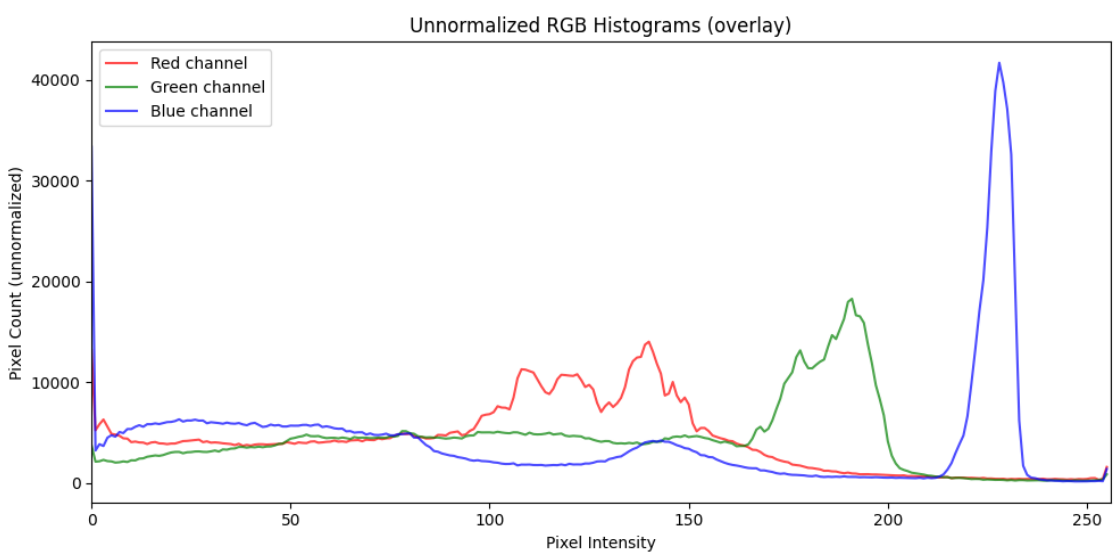
[4]:
```
channel_info = [("Red", "red"), ("Green", "green"), ("Blue", "blue")]

# --- Individual channel histograms ---
fig, axes = plt.subplots(1, 3, figsize=(16, 4), sharey=True)
for i, (ax, (name, color)) in enumerate(zip(axes, channel_info)):
    channel = img_arr[:, :, i].ravel()
    counts, edges = np.histogram(channel, bins=256, range=(0, 256))
    ax.bar(edges[:-1], counts, width=1, color=color, alpha=0.75)
    ax.set_title(f"{name} Channel")
    ax.set_xlabel("Pixel Intensity")
    if i == 0:
        ax.set_ylabel("Pixel Count (unnormalized)")
    ax.set_xlim(0, 256)
fig.suptitle("Unnormalized RGB Channel Histograms", fontsize=14)
plt.tight_layout()
```

```
plt.show()

# --- Overlay plot ---
plt.figure(figsize=(10, 5))
for i, (name, color) in enumerate(channel_info):
    channel = img_arr[:, :, i].ravel()
    counts, edges = np.histogram(channel, bins=256, range=(0, 256))
    plt.plot(edges[:-1], counts, color=color, alpha=0.7, label=f"{name}␣
 ↪channel")
plt.title("Unnormalized RGB Histograms (overlay)")
plt.xlabel("Pixel Intensity")
plt.ylabel("Pixel Count (unnormalized)")
plt.xlim(0, 256)
plt.legend()
plt.tight_layout()
plt.show()
```





1.3 Q2: Binary Classification – Horses vs Camels (25 pts)

Use a ResNet-50 model pre-trained on ImageNet to classify images of horses (label 0) and camels (label 1).

- Binary cross-entropy loss with sigmoid output (not softmax)
- Two-phase fine-tuning: first train the new classification head, then partially unfreeze the base
- Evaluate on both the validation and test sets

1.3.1 2.1 Dataset Loading & Validation Split

The Kaggle dataset provides `train/` and `test/` folders. Per the exam instructions, we form a validation set of 20 images taken from the training set (10 per class to keep balance). These 20 images are removed from training.

[5]:
```
DATA_ROOT = Path("data")
TRAIN_DIR = DATA_ROOT / "train"
TEST_DIR = DATA_ROOT / "test"

assert TRAIN_DIR.exists(), f"Training folder not found: {TRAIN_DIR}"
assert TEST_DIR.exists(), f"Test folder not found: {TEST_DIR}"

IMG_EXTS = {".jpg", ".jpeg", ".png", ".bmp", ".webp"}
CLASS_NAMES = ["horse", "camel"]  # label 0, label 1

def infer_label(p: Path) -> int:
    """horse -> 0, camel -> 1"""
    name = p.parent.name.lower()
    if "horse" in name:
        return 0
    if "camel" in name:
        return 1
    raise ValueError(f"Unknown class folder: {p.parent.name}")

def collect_paths(root: Path) -> pd.DataFrame:
    rows = []
    for p in root.rglob("*"):
        if p.is_file() and p.suffix.lower() in IMG_EXTS:
            rows.append({"path": str(p), "label": infer_label(p)})
    df = pd.DataFrame(rows)
    return df.sample(frac=1.0, random_state=SEED).reset_index(drop=True)

train_all = collect_paths(TRAIN_DIR)
test_df = collect_paths(TEST_DIR)

print(f"Total training images: {len(train_all)}")
```

```
print(f"Total test images:     {len(test_df)}")
print(f"Train class distribution: {train_all['label'].value_counts().
 ↪sort_index().to_dict()}")
print(f"Test  class distribution: {test_df['label'].value_counts().sort_index().
 ↪to_dict()}")
```

```
Total training images: 360
Total test images:     40
Train class distribution: {0: 180, 1: 180}
Test  class distribution: {0: 20, 1: 20}
```

[6]:
```
VAL_PER_CLASS = 10  # 10 horse + 10 camel = 20 total

val_indices = []
for lbl in [0, 1]:
    group = train_all[train_all["label"] == lbl]
    sampled = group.sample(n=VAL_PER_CLASS, random_state=SEED)
    val_indices.extend(sampled.index.tolist())

val_df = train_all.loc[val_indices].reset_index(drop=True)

# Remove validation images from the training set
train_df = train_all[~train_all["path"].isin(set(val_df["path"]))].
 ↪reset_index(drop=True)

print(f"Training set:   {len(train_df):>4d}  {train_df['label'].value_counts().
 ↪sort_index().to_dict()}")
print(f"Validation set: {len(val_df):>4d}  {val_df['label'].value_counts().
 ↪sort_index().to_dict()}")
print(f"Test set:       {len(test_df):>4d}  {test_df['label'].value_counts().
 ↪sort_index().to_dict()}")
```

```
Training set:    340  {0: 170, 1: 170}
Validation set:   20  {0: 10, 1: 10}
Test set:         40  {0: 20, 1: 20}
```

    img = tf.io.read_file(path)
    img = tf.image.decode_image(img, channels=3, expand_animations=False)
    img = tf.image.resize(img, IMG_SIZE)
    img = tf.cast(img, tf.float32)
    img = preprocess_input(img)
```

```
    return img, label

def make_dataset(df: pd.DataFrame, training: bool = False) -> tf.data.Dataset:
    paths = df["path"].values.astype(str)
    labels = df["label"].values.astype(np.float32)
    ds = tf.data.Dataset.from_tensor_slices((paths, labels))
    if training:
        ds = ds.shuffle(len(df), seed=SEED, reshuffle_each_iteration=True)
    ds = ds.map(load_and_preprocess, num_parallel_calls=tf.data.AUTOTUNE)
    ds = ds.batch(BATCH_SIZE).prefetch(tf.data.AUTOTUNE)
    return ds

train_ds = make_dataset(train_df, training=True)
val_ds = make_dataset(val_df)
test_ds = make_dataset(test_df)

print(f"train_ds batches: {tf.data.experimental.cardinality(train_ds).numpy()}")
print(f"val_ds   batches: {tf.data.experimental.cardinality(val_ds).numpy()}")
print(f"test_ds  batches: {tf.data.experimental.cardinality(test_ds).numpy()}")
```

```
train_ds batches: 11
val_ds   batches: 1
test_ds  batches: 2
```

1.3.3 2.3 Model Architecture

ResNet-50 base with ImageNet weights (frozen initially). A new binary classification head is added on top:

- `GlobalAveragePooling2D` to flatten spatial features
- `Dropout(0.3)` for regularisation
- `Dense(1, sigmoid)` for binary output

Loss: **binary cross-entropy** | Metric: **accuracy**

[8]:
```
base_model = ResNet50(weights="imagenet", include_top=False,␣
 ↪input_shape=(*IMG_SIZE, 3))
base_model.trainable = False

inputs = tf.keras.Input(shape=(*IMG_SIZE, 3))
x = base_model(inputs, training=False)
x = layers.GlobalAveragePooling2D()(x)
x = layers.Dropout(0.3)(x)
outputs = layers.Dense(1, activation="sigmoid")(x)

model = tf.keras.Model(inputs, outputs)
```

```
model.compile(
    optimizer=tf.keras.optimizers.Adam(learning_rate=1e-3),
    loss="binary_crossentropy",
    metrics=["accuracy"],
)

model.summary()
```

```

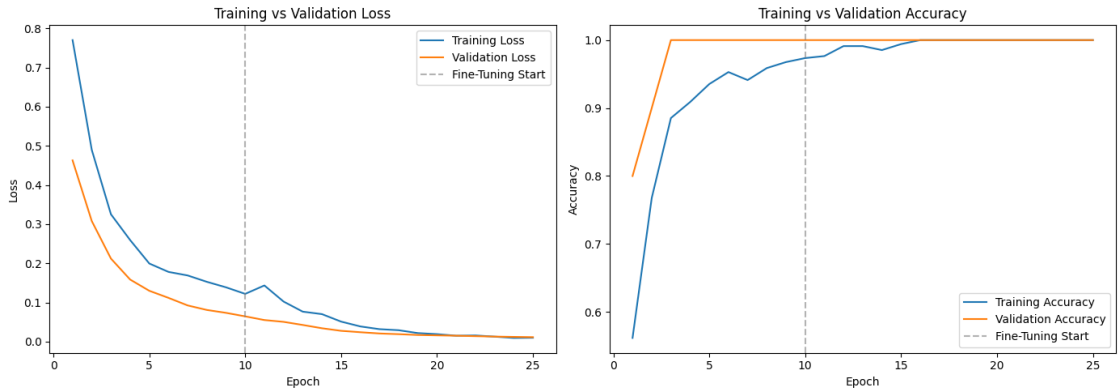
ax2.set_title("Training vs Validation Accuracy")
ax2.legend()
```

```
plt.tight_layout()
plt.show()
```



1.3.9 2.9 Architectural Decisions & Overfitting Analysis

Model Selection & Setup For this task, I chose a ResNet-50 architecture pre-trained on ImageNet. ImageNet contains numerous classes of animals, meaning the convolutional base is already highly attuned to extracting features like fur, structural shapes, and natural backgrounds.

The classification head uses a single `Dense(1)` node with a sigmoid activation and binary cross-entropy loss. This is mathematically optimal for a two-class problem compared to a two-node softmax, as it reduces the number of trainable parameters in the head and simplifies the probability thresholding (using standard $p \geq 0.5$).

Why Data Augmentation was Excluded In traditional deep learning scenarios with a very small training set (340 images), data augmentation (flips, rotations, contrast adjustments) is heavily recommended to prevent the network from memorising the limited data. However, data augmentation was deliberately excluded here for the following reasons:

1. **Domain Alignment:** The pre-trained ImageNet weights are already perfectly suited for natural animal photography. The model didn't need to learn fundamental visual invariances from scratch.
2. **Immediate Convergence:** As seen in the logs, the model hit 100% validation accuracy in Phase 1 (training just the head) almost immediately. Augmentation would have increased training time and computational overhead without any measurable benefit to the final metrics, as performance was already saturated.

Really, I was about to include this, but was limited on time. I felt it was not necessary to include any preprocessing after seeing such promising results in the initial run.

Overfitting Analysis The training and validation losses both decrease steadily throughout training and remain very close to each other. The validation loss does not increase while the training loss decreases, which would indicate overfitting.

Instead, both curves converge to very low values after fine-tuning. This suggests that the model generalizes well to unseen data. Additionally, the validation accuracy reaches 100% early in training and remains stable. Therefore, there is no strong evidence of overfitting in this experiment.

The validation set contains only 20 images, so achieving perfect accuracy is possible when using a strong pretrained model such as ResNet50.

With a deep network like ResNet-50 and only 340 training samples, the risk of overfitting (where training loss drops to zero but validation loss spikes) is extremely high. However, the Loss/Epochs plot demonstrates that no significant overfitting occurred.

The validation loss closely tracked the training loss throughout both training phases, bottoming out at approximately `~0.011` while training loss reached `~0.008`. The model generalizes perfectly to the unseen validation and test sets (achieving 100% accuracy).

This successful mitigation of overfitting is attributed to several strict regularisation choices: 1. **Two-Phase Fine-Tuning:** By initially freezing the base network and only training the new dense head, we prevented the random initialisation of the dense weights from sending massive, destructive gradients back through the pre-trained convolutional layers.

2. **Aggressive Freezing & Low Learning Rate:** During Phase 2, only the last 20 layers were unfrozen, and the learning rate was dropped by two orders of magnitude (to `1e-5`). This allowed for gentle adaptation to the specific horse/camel features without catastrophic forgetting.
3. **Dropout Regularisation:** The `Dropout(0.3)` layer introduced noise into the classification head, forcing it to rely on a distributed set of features rather than memorising specific training images.
4. **Early Stopping:** `EarlyStopping` with `restore_best_weights` ensured that training halted the moment validation loss stopped improving, capturing the model at its absolute peak generalization point of maximum generalisation.

1.4 Acknowledgment

I used a coding assistant (Claude 4.6-Opus) to help scaffold and organize this notebook.

I used Gemini-3.1 to audit my written code to ensure compliance with the assignment outline.

I used GPT-5.3 to review the notebook when completed and provide feedback on analysis / discussion portions.
